The Solution to Flood Control

WL Series

The concept of the Water-Gate is simple: it's the weight of the water that stops the water. Its unique design, makes it possible for the water to enter inside the fabric and it stabilizes the barrier instantaneously. No need to pump water or inflate air inside for set up.

The **Water-Gate** water barrier is manufactured only with resistant materials that are corrosion proof and resist toxic products.

The WL series barrier is specially designed with integrated ballasting on the front flap to control water and floods. It is possible to attach it with all other models of barriers. The water barrier can be stored during long periods of time with no impact on it's structure.

This crate contains 500 feet of barriers (152 m) of WL-2650 folded like an accordeon, capable of being **set up in less than 2 minutes.**

Switzerland

Manitoba

New Zealand

Protection up to 5 feet (1.5 m) - any length

The Solution to Control water in urban environments

WL Series

Set up in seconds

Many applications:

- The maintenance of fire hydrants to prevent water from flowing in all directions without interrupting traffic,
- To deviate surface water during strong rains or fire interventions,
- As a prevention during pressure testing of the pipelines,
- Intervention during aqueduct leak in the summer like in the winter; the ice does not affect the water barrier at all, nor does it affect its effectiveness.

Illustrated barrier: WL-0630

Nothing in the world exceeds the Water-Gate

The Solution for aquatic works

WA Series

The **Water-Gate** revolutionizes the method coffer dams are built, in respect to the environment. This barrier can block rivers and create dry areas to allow working in just a few minutes in an ecological, fast, effective and reliable way.

A parallel current doesn't block the barrier, even if the current is very vigorous.

The water barrier can be installed on very steep walls.

Channelling water alongside the work area with the diverter.

The water barrier can be curved in all directions, in a round corner or a pointed angle.

The Solution to Water reserves

WA Series

Creating water reserve has never been easier.

The **Water-Gate** is equipped with a back flap to prevent mining the river's bottom if overtopping occurs. Also the front flap is useful to settle the strainer when pumping, it prevents costly damage to the pump.

The WA 2835 is the model most commonly used when firefighters need to create water reserve in rural areas or forest fires.

The Solution to Oil spills

WA Series

Release holes are installed strategically to let fresh water go and contain oil on top for pumping
